Plumbing Concept Design: Visualizing Customer Data Flow

Explore how customer data flows through Iris Security Architectures using an intuitive plumbing metaphor. This presentation visualizes the four distinct integration pathways that enable secure, managed, and targeted data delivery.

Overview of the Customer Data Flow

Customer Entry Point

Customer data enters through the main intake pipe and is intelligently routed through three distinct valves to different management scenarios.

3

Data Valves

100%

Flow Control

The Intake — Main Supply Pipe

Main Supply

Raw Data Entry Point

Entry point for customer data into the Iris platform infrastructure. The Main Supply pipe serves as the primary ingestion channel for all raw customer information.

Active Flow

The Diverter: Four Integration Branches

Iris Interface Options for Routing Data

The main supply pipe diverts into four distinct integration branches, each representing a unique Iris interface option for routing customer data. These pathways offer flexibility from granular API control to fully managed portal solutions.

API

API Integration

Teal valves providing granular control over data endpoints.

SDK

SDK Integration

Indigo tool-kit junction boxes for developer integration.

Portal

OnWatch® Portal

Polished navy enclosed pipe for fully managed secure flow.

Micro-Experience

Streamlined teal pipe for targeted microservice delivery.

API Integration Branch

Granular Control Valves

Detailed control over data with flexible API endpoints. The API Integration Branch provides granular control points through configurable valves, enabling precise management of customer data flow.

Each teal valve represents a control point where data can be filtered, transformed, or routed based on specific business requirements.

SDK Integration Branch

Developer Toolkit

The SDK Integration Branch provides developers with a comprehensive toolkit for seamless integration into applications. Junction boxes along the pipeline represent modular developer tools that simplify implementation. This branch enables rapid deployment while maintaining the flexibility developers need to customize data flow within their existing application architecture.

OnWatch® Portal Branch

Fully Managed Security

The OnWatch® Portal branch represents a premium, fully managed pathway for customer data. This enclosed pipe system ensures maximum security with end-to-end protection, automated monitoring, and enterprise-grade compliance.

Designed for organizations requiring hands-off data management with complete visibility and control through the Iris platform.

Micro-Experience Branch

Streamlined Data Delivery

The Micro-Experience Branch delivers streamlined, targeted data pathways designed for precise delivery to microservices. This focused approach ensures efficient data routing with minimal overhead.

Focused pathways for precise data delivery to microservices, enabling rapid response times and optimized resource utilization across the Iris platform.

Scenario A

Secure Data

Management

Premium Protection Pathway

This pathway represents premium, protected data management where customer information flows through secure channels into protected storage.

The gold-tinted polished pipe symbolizes the trusted route for sensitive data, leading directly to vault-level protection and encrypted handling.

Scenario B

Data at Risk

Vulnerability Visualization

This pathway visualizes the dangers of unprotected customer data flow. The leaky pipe design represents vulnerabilities where sensitive information can escape, be compromised, or fall into unauthorized hands. Red warning indicators highlight critical breach points requiring immediate attention and remediation.

Management Comparison Chart

API Integration

High

- ☒ Control Level: Granular
- ☐ Implementation: Moderate
- ☐ Security: Configurable
- ☐ Management: Self-service
- ☐ Complexity: Medium-High
- ☐ Best for: Custom builds

OnWatch® Portal

Premium

- ☒ Control Level: Managed
- ☒ Implementation: Fast
- ☒ Security: Maximum
- ☒ Management: Fully managed
- ☒ Complexity: Low
- ☒ Best for: Enterprise

SDK Integration

Flexible

- ☒ Control Level: Moderate
- ☒ Implementation: Quick
- ☒ Security: Built-in
- ☒ Management: Hybrid
- ☐ Complexity: Medium
- ☐ Best for: Developers

Key Insights and Takeaways

Plumbing Concept Design Summary

The plumbing metaphor provides a clear, intuitive visualization of customer data flow through Iris security architectures. Four distinct integration branches—API, SDK, OnWatch® Portal, and Micro-Experience—offer flexible options for every use case, with secure and targeted delivery pathways.

4

Integration Branches

API, SDK, OnWatch® Portal, and Micro-Experience pathways for flexible data routing.

100%

Visual Clarity

Intuitive plumbing metaphor makes complex data flows easy to understand.

Seamless Flow

Directional arrows and control points indicate dynamic data movement.

Secure Delivery

Managed and targeted pathways ensure maximum security and precision.
